Abstract: A second cytoplasmic dynein heavy chain (cDhc) has recently been identified in several organisms, and its expression pattern is consistent with a possible role in axoneme assembly. We have used a genetic approach to ask whether cDhclb is involved in flagellar assembly in Chlamydomonas. Using a modified PCR protocol, we recovered two cDhc sequences distinct from the axonemal Dhc sequences identified previously. cDhcla is closely related to the major cytoplasmic Dhc, whereas cDhclb is closely related to the minor cDhc isoform identified in sea urchins, Caenorhabditis elegans, and Tetrahymena. The Chlamydomonas cDhclb transcript is a low-abundance mRNA whose expression is enhanced by deflagellation. To determine its role in flagellar assembly, we screened a collection of stumpy flagellar (stf) mutants generated by insertional mutagenesis and identified two strains in which portions of the cDhclb gene have been deleted. The two mutants assemble short flagellar stumps (<1-2  $\mu$ m) filled with aberrant microtubules, raft-like particles, and other amorphous material. The results indicate that cDhclb is involved in the transport of components required for flagellar assembly in Chlamydomonas.
